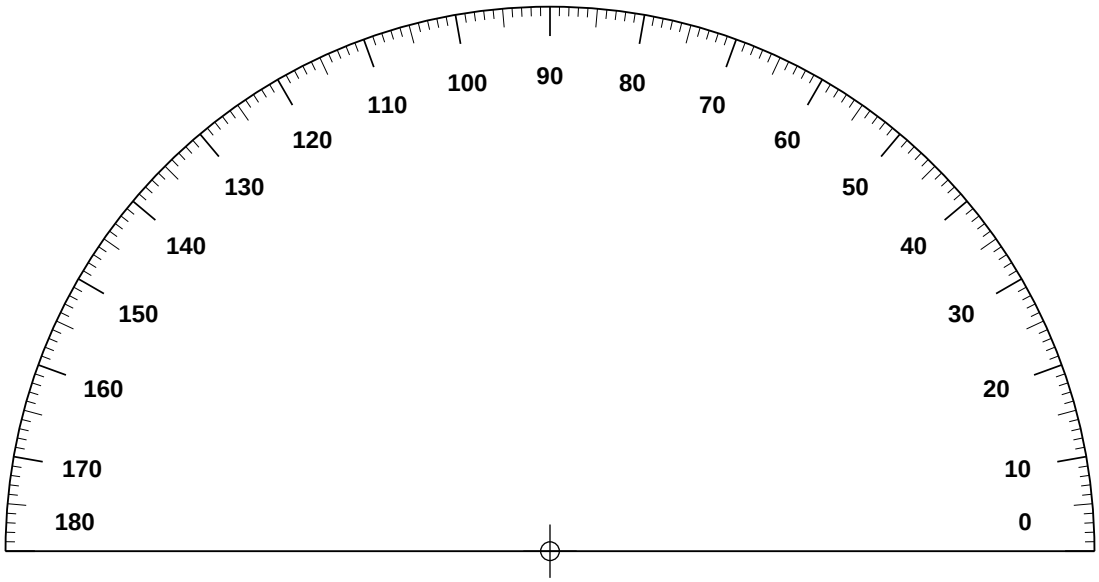
SparkBench angular reference

Print at 100% / Actual Size. Disable Fit to Page. Keep the paper flat.

Preparation only. Keep servo power off until the joint test is explicitly authorized.



CENTRE - align with shaft axis

Right-hand baseline = 0 degrees; left-hand baseline = 180 degrees

Placement for the joint session

1. We will choose a fixed zero direction relative to the servo case.
2. The scale must be flat and parallel to the horn's rotation plane.
3. Align its centre with the shaft axis; avoid an oblique reading/parallax.
4. Keep the horn's full travel clear. Do not turn the horn by hand.
5. Read the scale independently; a pulse command is never an angle reading.

Do not reposition the phone, servo or existing grid just to place this sheet now.

Reference record (completed together)

Role / image	Pulse (us)	Scale reading (deg)	Reading uncertainty
